The primary objective of this program was to further the research goals of AFOSR in plasma physics. MRC's role in this program was to collaborate with other AFOSR-sponsored researchers in the development and application of state-of-the-art computational methods to critical research problems. The principal mechanism for this collaboration was the joint research group. The objectives of this group includes not only the performance of superior research, but also the advancement of computational research methods by focusing the combined resources and capabilities of the entire community. The joint research group was established several years ago. Charter members include five universities (Texas Tech, Univ of Michigan, UCLA, MIT, and King's College) in addition to MRC. The research initially focused on problems such as plasma guns and microwave tube research. MRC provided the other participants with codes and related materials and, as their expertise grew, participated with them in their research and analyses and in the formulation of future research and modeling requirements. At present the group has expanded to include 17

universities and 6 government agencies. The scope of research has also expanded to include new topics, including novel beam emission sources and pulsed-power switches. Special edition of the Federal Register, containing a codification of documents of general applicability and future effect ... with ancillaries. At Last! This book is designed to prove of interest to microwave engineers working with MESFET devices. By 1990 the wireless revolution had begun. In late 2000, Mike Golio gave the world a significant tool to use in this revolution: The RF and Microwave Handbook. Since then, wireless technology spread across the globe with unprecedented speed, fueled by 3G and 4G mobile technology and the proliferation of wireless LANs. Updated to reflect this tremendous growth, the second edition

of this widely embraced, bestselling handbook divides its coverage conveniently into a set of three books, each focused on a particular aspect of the technology. Six new chapters cover WiMAX, broadband cable, bit error ratio (BER) testing, high-power PAs (power amplifiers), heterojunction bipolar transistors (HBTs), as well as an overview of microwave engineering. Over 100 contributors, with diverse backgrounds in academic, industrial, government, manufacturing, design, and research reflect the breadth and depth of the field. This eclectic mix of contributors ensures that the coverage balances fundamental technical issues with the important business and marketing constraints that define commercial RF and microwave engineering. Focused chapters filled with formulas, charts, graphs, diagrams, and tables make the information easy to locate and apply to practical cases. The new format, three tightly focused volumes, provides not only increased information but also ease of use. You can find the information you need quickly, without wading through material you don't immediately need, giving you access to the caliber of data you have come to expect in a much more user-friendly format. Global mobile satellite communications (GMSC) are specific satellite communication systems for maritime, land and aeronautical applications. It enables connections between moving objects such as ships, vehicles and aircrafts, and telecommunications subscribers through the medium of communications satellites, ground earth stations, PTT or other landline telecommunications providers. Mobile satellite communications and technology have been in use for over two decades. Its initial application is aimed at the maritime market for commercial and distress applications. In recent years, new developments and initiatives have resulted in land and aeronautical applications and the introduction of new satellite constellations in non-geostationary orbits such as Little and Big LEO configurations and hybrid satellite constellations as Ellipso Borealis and Concordia system. This book is important for modern shipping, truck, train and aeronautical societies because GMSC in the present millennium provides more effective business and trade, with emphasis on safety and commercial communications. Global Mobile Satellite Communications is written to make bridges between potential readers and current GMSC trends, mobile system concepts and network architecture using a simple mode of style with understandable technical information, characteristics, graphicons, illustrations and mathematics equations. Global Mobile Satellite Communications represents telecommunications technique and technology, which can be useful for all technical staff on vessels at sea and rivers, on all types of land vehicles, on planes, on off shore constructions and for everyone possessing satellite communications handset phones. A comprehensive source for microwave and wireless circuit design, the Commercial Wireless Circuits and Components Handbook reviews the fundamentals of transmitters and receivers, then presents detailed chapters on individual circuit types. It also covers packaging, large and small signal characterization, and high volume testing techniques for both devices and circuits. This handbook not only provides important information for engineers working with wireless RF or

microwave circuitry, it also serves as an excellent source for those requiring information outside of their area of expertise, such as managers, marketers, and technical support workers who need a better understanding of the fields driving their decisions. This software package seeks to improve waveguide filter and diplexer design and decrease performance variations without creating overly stringent manufacturing tolerances. The accompanying manual helps the reader to cut design time and improve accuracy by quickly and easily predicting performance parameters before building costly prototypes. Using the mode-matching method as a foundation, the software supplies a full-wave solution for filter discontinuities, aiding you in the design of E-plane waveguide filters specifically intended for microwave and millimeter-wave applications. This means you can substantially reduce development and production costs, reduce time-to-market, and effectively increase circuit performance. At Last! The Startup Owner's Manual was originally published by K&S Ranch Publishing Inc. and is now available from Wiley. The cover, design, and content are the same as the prior release and should not be considered a new or updated product. MARTHA is a set of general-purpose programs for analyzing linear electrical networks, available to users with access to APL time-sharing systems. The programs analyze, as a function of frequency, most linear "transmission-type" networks, with an input and an output. This includes most filters, amplifiers, microwave networks, and feedback systems, even if such circuits are relatively complicated, with multiple feedback paths and branches. The programs cannot handle some complicated interconnections of components, and are not set up to analyze nonlinear or time varying networks. The topology of the network is described using "wiring operators." The elements available include lumped and distributed, active and passive, reciprocal and nonreciprocal elements. The possible output includes tow-port parameters (impedance, admittance, hybrid, scattering, and ABCD matrices), as well as voltage gain, insertion gain, transducer gain, etc. These, their real or imaginary parts, or magnitude or phase, may be printed or plotted as functions of frequency or of each other. More than one network can be analyzed simultaneously. MARTHA is not inherently better at one frequency range than another, except perhaps in its repertoire of elements and response functions. MARTHA includes, besides R, L, and C, sixteen controlled sources; operational amplifiers; mutual inductance; three transistor models and the possibility of easily creating others; ideal transformers; several

composite pi and tee structures; and a few exotic elements such as gyrators. For high-frequency applications MARTHA has several microwave elements, including TEM transmission lines, waveguides, attenuators, and isolators. A self-contained guide to microwave electronics, covering passive and active components, linear, low-noise and power amplifiers, microwave measurements, and CAD techniques. It is the ideal text for graduate and senior undergraduate students taking courses in microwave and radio-frequency electronics, as well as professional microwave engineers. The major purpose of this research is to provide a computer aided analysis and design capability for microwave reflector antenna systems, in the 1-40 GHz range. This capability will allow for the prediction of antenna gain and antenna temperature performance of reflector antennas, under various

atmospheric conditions. The analysis and design capability was accomplished in part by further development of the OSU Reflector Antenna Code. The analysis capability of the Reflector Code was used to guide the design of the seven reflector antennas, of both the focal point and Cassegrain types. These seven reflector antenna designs were fabricated and tested. The measured data obtained from these tests were used to validate the Reflector Antenna Code. The use of the Reflector Antenna code is documented in Volume III of this final report. This report documents the seven reflector antenna designs which were fabricated and measured to demonstrate and test the computer aided analysis and design capability. Selected pattern and gain data calculated by the Reflector Antenna Code and the validating measured data are given. A more comprehensive set of measured data for the seven reflector antenna designs is presented in Volume II of

this final report. Presents twenty-six programs for use to solve main equations that are presented in the author's text.
