It is a branch of engineering that studies the measurement and control of process variables and the design and implementation of systems that incorporate them. Process variables include pressure, temperature, humidity, flow, pH, force, and speed. It combines two branches of engineering: web general electronic instrumentation in the world of mechanical devices. Today, most measurements are made by electronic instrumentation, not the crude mechanical devices of the past. Most of these newer devices are actually a modern combination of a mechanical device and electronic sensing element.

electronic instrumentation has also benefited from advances made in signal processing and data processing. In many measurement problems, the required information cannot easily be extracted from measurable signals. An example is shown in fig 1.5.

Web topics covered: analysis and design of special amplifiers, operational circuits, power switching circuits, etc. used in instrumentation and control.

Sample topics include: circuit limitations such as speed of response, noise, distortion, power gain, etc. Emphasis is on analog electronics.

Web electronic and instrument technicians are part of the i.e. technician work group and will primarily share work assignments within their job grouping with no inherent or system imposed limits based on business needs. I.e. technicians will perform maintenance activities including crossing between job groupings where skills are common.
