Management and Economics of Construction Safety in Hong Kong Apr 05 2021 Hong Kong had a very bad record in construction safety in the 1980s and before. Since the early 1990s, a number of statutory regulations have been enforced in order to improve safety in Hong Kong's construction industry. The results of these efforts can gradually be seen, and this is evidenced by the significant drop in construction accidents in recent years. This book is important in keeping construction professionals informed about Hong Kong's experience in construction safety. It begins with an overview of safety management systems generally adopted in the Asian context with the support of construction accident statistics from a number of countries or cities. Other topics include factors which influence site safety programmes, construction safety management systems, safety legislation, safety auditing, the procedure of accident investigation, the Hong Kong government's mandatory SSPS (Site Supervision Plan System) that all contractors and authorized persons/registered structural engineers have to follow, and construction safety economics.

Handbook of OSHA Construction Safety and Health Oct 31 2020 Although the construction industry employs only five percent of the nation's work force, it suffers 20 percent of the nation's occupational fatalities and 12 percent of all U.S. injuries. Because of this the Occupational Safety and Health Administration (OSHA) has consolidated their construction standards, compliance assistance, cooperative programs, and technical services to form the Directorate of Construction. Construction sites and operations have become the prime targets for the Directorate of Construction, which has greatly increased its number of inspections, citations and penalties. The Handbook of OSHA Construction Safety and Health is for safety professional, contractor, project manager and owner who has the responsibility of implementing an effective on-site safety and health program. These professionals are now in charge of everything from the safe operation of equipment to the safe removal of hazardous waste from the construction site. It is a practical guide that can be used by the construction industry on existing and future projects and jobsites in the critical area of occupational safety and health. Written using OSHA's Construction standards as a framework, the book provides those responsible for construction safety and health with a definitive guide for eliminating safety and health hazards from construction worksites. In addition, the handbook addresses subjects such as contractor liability, multi-employer sites and focused inspection which are real and time problem areas faced by the construction industry. The handbook of OSHA Construction Safety and Health contains a model safety and health program, examples of accident analysis and prevention approaches, sample safety and health checklist and forms, and over 300 illustrations.

Construction Safety Planning Jan 14 2022 Construction Safety Planning David V. MacCollum Construction Safety Planning is a comprehensive, practical, step-by-step guide for those who design and oversee large and small projects. Designed to facilitate compliance with new OSHA objectives, it presents, for those who are responsible for construction safety, what questions to ask in order to avoid conditions that invite injury or death on site. The book shows how to integrate safety planning into existing design and construction scheduling in order to avoid duplicating paperwork that is normally associated with safety planning. Advice is given on how to involve all supervisory personnel as hazard hunters, so that timely prevention measures can be taken. Author David V. MacCollum is a forty-five-year veteran safety engineer who participated in the development of safety planning concepts used by the U.S. Army Corps of Engineers on big dam projects in the Pacific Northwest during the 1950s. In this clearly written reference he highlights the concepts and practices that reduced construction deaths by 75 percent and are today still enabling the Corps of Engineers to enjoy the same reduction nationwide, when compared to similar work not under its supervision--the end result being savings of several billion dollars each year. The risk of death on the job for construction workers is five times greater than that of the average American worker. A new OSHA era will change that. With this book, everyone working in the field of construction--from design to maintenance--will have the tools and knowledge to make a difference.

Construction Safety Dec 25 2022 A close-to-ideal blend of suburb and city, speedy construction of towers of Babylon, the sparkling proportion of glass and steel buildings' facade at night showcase the wisdom of humans. They also witness the footsteps, sweats and tears of architects and engineers. Unfortunately, these signatures of human civilizations are swathed in towering figures of construction accidents. Fretting about these on sites, different countries adopt different measures on sites. This book firstly sketches the construction accidents on sites, followed by a review on safety measures in some of the developing countries such as Bermuda, Egypt, Kuwait and China; as well as developed countries, for example, the United States, France and Singapore. It also highlights the enormous compensation costs with the courts' experiences in the United Kingdom and Hong Kong.

Construction Health and Safety in Developing Countries Oct 11 2021 The global construction sector is infamous for high levels of injuries, accidents and fatalities, and poor health and well-being of its workforce. While this record appears in both developed and developing countries, the situation is worse in developing countries, where major spending on infrastructure development is expected. There is an urgent need to improve construction health and safety (H&S) in developing countries. The improvement calls for the development of context-specific solutions underpinned by research into challenges and related solutions. This edited volume advances the current understanding of construction H&S in developing countries by revealing context-specific issues and challenges that have hitherto not been well explored in the literature, and applying emergent H&S management approaches and practices in developing countries. Coverage includes countries from the regions of sub-Saharan Africa, Latin America, Asia and Europe. This book, which is the first compendium of research into construction H&S issues in developing countries, adds considerable insight into the field and presents innovative solutions to help address poor H&S in construction in developing nations. It is a must read for all construction professionals, researchers and practitioners interested in construction and occupational H&S, safety management, engineering management and development studies.

Construction Safety Management Systems Nov 24 2022 The construction industry has a distressingly poor safety record, whether measured in absolute terms or alongside other industries. The level of construction safety in a country is influenced by factors such as variations in the labour forces, shifting economies, insurance rates, legal ramifications and the stage of technological development. Yet the problem is a world-wide one, and many of the ways of tackling it can be applied across countries. Effective tools include designing, preplanning, training, management commitment and the development of a safety culture. The introduction and operation of effective safety management systems represents a viable way forwards, but these systems are all too rarely implemented. How can this be done? Should we go back to prescriptive legislation? This book considers these questions by drawing together leading-edge research papers from the proceedings of an international conference conducted by a commission (W099) on Safety and Health on Construction Sites of CIB, the international council of building research organisations.

Safety and Health in Construction Apr 17 2022 "It goes a long way in mapping out the agenda for health and safety professionals in this most dangerous and populous industry." *Annals of Occupational Hygiene*, Derby, United Kingdom Changes in working practices and conditions in the construction industry over the past decade have meant that the competent authorities, health and safety committees, management or employers' and workers' organizations, in particular, should take a fresh look at such aspects as the safety of workplaces, health hazards, and construction equipment and machinery. 4-dimensional Process-aware Site-specific Construction Safety Planning Aug 29 2020 The construction industry has one of the worst occupational health and safety records of all industries. In spite of stringent regulations and much attention towards reducing risks in the physical environment, the construction industry continues to be associated with high levels of accidents, injuries, and illnesses. Construction safety management activities are typically categorized into safety planning and execution processes. Despite the interdependent relationship between safety planning and execution processes, current safety planning processes lack a systematic approach because of limited safety tools and site-specific information available. As a result, safety planning and execution processes are generally segregated and, consequently, most safety execution processes rely on ad-hoc safety activities during construction. The objective of this research is to systematically formalize the construction safety planning process in a 4-dimensional (4D) environment to address site-specific temporal and spatial safety information, by leveraging project schedules and information technology to improve current construction safety management practices. Prior to developing a specific framework, this research presents a safety risk generation and control model to describe the phenomenon of dynamic safety risk, incorporating construction domain knowledge. The proposed model addresses how the inherent risk of a worker can be transformed by different measurable contexts of activities. Based on the theoretical model, this research assessed safety risk of different construction trades in a quantitative manner. By integrating multiple national injury databases, safety risks of different construction occupations were analyzed to explain common risk types, sources of injury, and risk scenarios associated with each occupation type. With results of safety risk analysis as a reference, a formalized safety planning framework to aid in developing a long-term safety risk prediction plan was proposed. The proposed framework analyzed activity, work period, and work zone safety by integrating a project schedule and a 3D model. The proposed safety planning process was tested in a real-world project. This research advances safety knowledge, integrating site-specific temporal and spatial information, and significantly affecting the construction safety planning process. The proposed safety planning approach can provide safety personnel with a site-specific proactive safety planning tool that can be used to better manage jobsite safety by predicting activity risk, work period risk, and work zone risk in advance. In addition, visual safety materials can also aid in training workers on safety and, consequently, being able to identify site-specific hazards and respond to them effectively.
